BLUELINK CONSULTS

Incident response and operating runbook

ILLUSTRATIVE SAMPLE - FICTIONAL INFORMATION

A fictional diagnostic service experiences failed appointment requests. This sample demonstrates incident ownership, restoration checks and the evidence retained after recovery.

1. Detection and triage

Confirm user impact, affected services and incident start time. Assign an incident lead. Check application errors, database health and recent releases. Use sanitized evidence; do not copy patient information into incident records.

2. Restoration responsibilities

Illustrative response steps. Escalation times and recovery objectives must be agreed with the client.

Action	Responsible role	Evidence
Confirm impact and severity	Incident lead	Impact statement and timeline
Investigate service dependencies	Application / infrastructure owner	Logs, health checks and change history
Approve restoration approach	Authorized service owner	Decision and recovery plan
Validate restored service	Application owner	Smoke checks and user workflow tests

3. Recovery checks

Confirm appointment creation and retrieval, check queued work, reconcile affected records and observe agreed service signals. Keep the incident open until the service owner accepts the recovery evidence.

4. Review and handover

Document the timeline, contributing factors, restoration actions and unresolved risks. Assign preventive actions with owners and review dates. Handover includes alert routing, escalation contacts, recovery instructions and the next review checkpoint.

This sample illustrates document structure, not completed client work or a certification. Final scope, responsibilities and acceptance criteria are agreed before implementation.
